Abstract

The invention relates to a wireless radiofrequency data communication system comprising:

- a base-station comprising multiple first sets and a signal processing-unit, wherein each first
 set comprises a transmitter- and receiver-unit provided with a transmitter and a receiver and
 at least one antenna which is connected to the transmitter- and receiver-unit, wherein the
 signal processing-unit is connected with each of the first sets for processing signals
 received by the first sets and processing signals to be transmitted by the first sets, and
- multiple second sets, wherein each second set comprises a transmitter- and receiver-unit provided with a transmitter and a receiver and at least one antenna which is connected to the transmitter- and receiver-unit.
